1. Make a program in which child process asks the user for their name and roll no and parent process will read and print it on screen, this should be done by unnamed pipes.

2. For the program created above switch the sequence of read and write processes, firstly perform read process and then write process. Do you observe any change in output?

3. Run the FIFO example with two read processes and two write process as:
   Write process 1 should write: Your full name
   Write process 2 should write: Your favorite food
